1 Project Description and Impact Summary

1.1 Introduction

This study analyzes the potential noise and vibration impacts of the proposed John Smith Road Landfill Expansion Project (project) in San Benito County, California. Rincon Consultants, Inc. (Rincon) prepared this study for Douglas Environmental (applicant) for use in support of environmental documentation pursuant to the California Environmental Quality Act (CEQA). The purpose of this study is to analyze the project's noise and vibration impacts related to both temporary construction activity and long-term operation of the project. Table 1 provides a summary of project impacts.

Table 1 Summary of Impacts

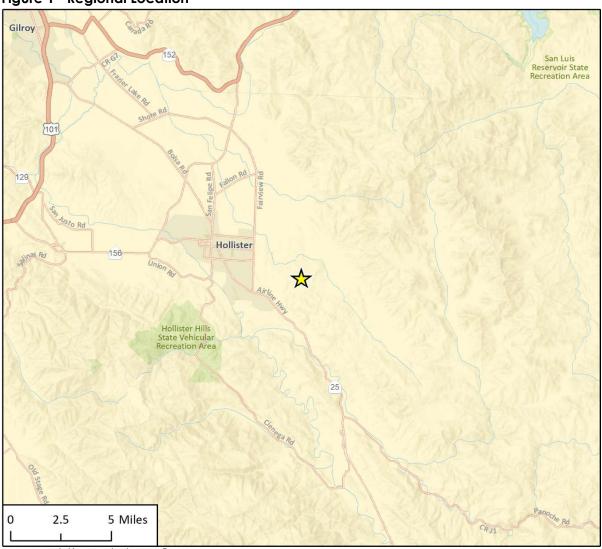

Impact Statement	Level of Significance	Applicable Recommendations
Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	Less than Significant (Construction) Off-site traffic increases conflict with threshold (Operation)	None NOI-1 (pavement surfacing/soundwalls)
Would the project result in generation of excessive groundborne vibration or groundborne noise levels?	Less Than Significant Impact	None
For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	No Impact	None

1.2 Project Summary

Project Location

The 388.05-acre project site is located in San Benito County, California. The project site lies directly north and west of the existing 95.16-acre John Smith Road Landfill (JSRL). The JSRL is located at 2650 John Smith Road, approximately 2 miles east of the eastern boundary of the City of Hollister. The project site is in a hilly rural area east of the Hollister Valley and west of the Santa Ana Valley in unincorporated San Benito County. Surrounding land uses include rural residential uses to the southwest, west, and east and vacant land to the south and north. John Smith Road borders the project to the south. Figure 1 shows the project site's regional location and Figure 2 shows an aerial view of the project site and surrounding area.

ig 1 Regional Location

Figure 2 Project Site Location

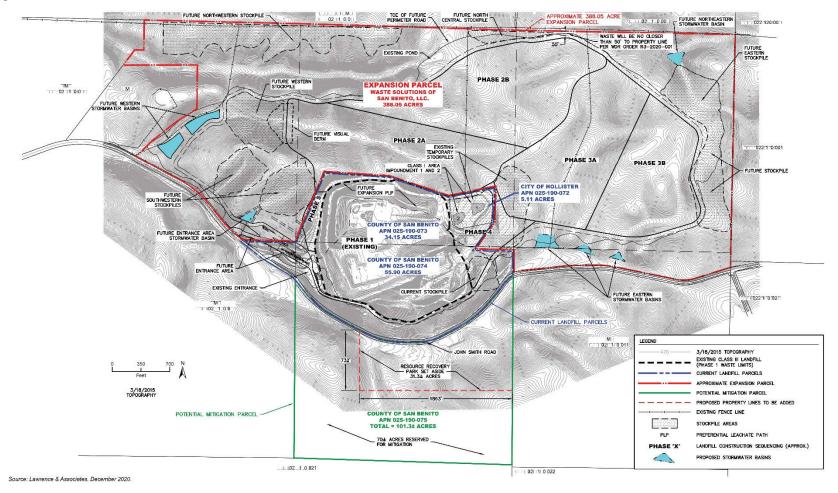

Noise and Vibration Study

Project Description

The project would include a 388.05-acres expansion of the existing landfill to the east, north, and west. The expansion would increase the landfill's disposal capacity from approximately 9.35 million cubic yards to 58 million cubic yards, expand the total waste footprint from 58 acres to 253 acres, increase the maximum permitted elevation of the final landfill from 920 feet mean sea level (msl) to 949 feet msl, and increase the maximum permitted daily tonnage accepted at the JRSL from 1,000 tons per day to 2,300 tons per day for waste to be buried.

To accommodate the proposed expansion, the landfill entrance would also be expanded from approximately 2.7 acres to 7.3 acres to accept additional daily vehicle arrivals and reduce vehicle queuing on John Smith Road from the current 800 feet to 820 feet and provide two inbound lanes when needed, establish an area for future installation of a gas-to-energy facility that could include power generation or clean gas for equipment and vehicles, converting the current Class I area owned by the City of Hollister to a Class III disposal area. The proposed project also includes a General Plan amendment to change the 388.05-acre expansion property's land use designations of Rangeland (RG) and Agriculture (A) to Public/Quasi-Public (PQP) to be consistent with the existing JSRL's land use designations and to accommodate the proposed waste disposal activities. Figure 3 shows the project plan layout.

Figure 3 Site Plan

Noise and Vibration Study

2 Background

2.1 Overview of Sound Measurement

Sound is a vibratory disturbance created by a moving or vibrating source, which is capable of being detected by the hearing organs. Noise is defined as sound that is loud, unpleasant, unexpected, or undesired and may therefore be classified as a more specific group of sounds. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and, in the extreme, hearing impairment (California Department of Transportation [Caltrans] 2013).

Noise levels are commonly measured in decibels (dB) using the A-weighted sound pressure level (dBA). The A-weighting scale is an adjustment to the actual sound pressure levels so that they are consistent with the human hearing response, which is most sensitive to frequencies around 4,000 Hertz and less sensitive to frequencies around and below 100 Hertz (Kinsler, et. al. 1999). Decibels are measured on a logarithmic scale that quantifies sound intensity in a manner similar to the Richter scale used to measure earthquake magnitudes. A doubling of the energy of a noise source, such as doubling of traffic volume, would increase the noise level by 3 dBA; reducing the energy in half would result in a 3 dBA decrease (Crocker 2007).

Human perception of noise has no simple correlation with sound energy: the perception of sound is not linear in terms of dBA or in terms of sound energy. Two sources do not "sound twice as loud" as one source. It is widely accepted that the average healthy ear can barely perceive changes of 3 dBA, increase or decrease (i.e., twice the sound energy); that a change of 5 dBA is readily perceptible (8 times the sound energy); and that an increase (or decrease) of 10 dBA sounds twice (half) as loud ([10.5x the sound energy] Crocker 2007).

Sound changes in both level and frequency spectrum as it travels from the source to the receiver. The most obvious change is the decrease in level as the distance from the source increases. The manner in which noise reduces with distance depends on factors such as the type of sources (e.g., point or line, the path the sound will travel, site conditions, and obstructions). Noise levels from a point source typically attenuate, or drop off, at a rate of 6 dBA per doubling of distance (e.g., construction, industrial machinery, ventilation units). Noise from a line source (e.g., roadway, pipeline, railroad) typically attenuates at about 3 dBA per doubling of distance (Caltrans 2013). The propagation of noise is also affected by the intervening ground, known as ground absorption. A hard site, such as a parking lot or smooth body of water, receives no additional ground attenuation and the changes in noise levels with distance (drop-off rate) result from simply the geometric spreading of the source. An additional ground attenuation value of 1.5 dBA per doubling of distance applies to a soft site (e.g., soft dirt, grass, or scattered bushes and trees) (Caltrans 2013). Noise levels may also be reduced by intervening structures. The amount of attenuation provided by this "shielding" depends on the size of the object and the frequencies of the noise levels. Natural terrain features such as hills and dense woods, and man-made features such as buildings and walls, can substantially alter noise levels. Generally, any large structure blocking the line of sight will provide at least a 5-dBA reduction in source noise levels at the receiver (Federal Highway Administration [FHWA] 2011). Structures can substantially reduce exposure to noise as well. The FHWA's guidelines indicate that modern building construction generally provides an exterior-to-interior noise level reduction of 20 to 35 dBA with closed windows.

The impact of noise is not a function of loudness alone. The time of day when noise occurs and the duration of the noise are also important factors of project noise impact. Most noise that lasts for more than a few seconds is variable in its intensity. Consequently, a variety of noise descriptors have been developed. One of the most frequently used noise metrics is the equivalent noise level (Leq); it considers both duration and sound power level. Leq is defined as the single steady A-weighted level equivalent to the same amount of energy as that contained in the actual fluctuating levels over time. Typically, Leq is summed over a one-hour period. Lmax is the highest root mean squared (RMS) sound pressure level within the sampling period, and Lmin is the lowest RMS sound pressure level within the measuring period (Crocker 2007).

Noise that occurs at night tends to be more disturbing than that occurring during the day. Community noise is usually measured using Day-Night Average Level (L_{dn}), which is the 24-hour average noise level with a +10 dBA penalty for noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours; it is also measured using Community Noise Equivalent Level (CNEL), which is the 24-hour average noise level with a +5 dBA penalty for noise occurring from 7:00 p.m. to 10:00 p.m. and a +10 dBA penalty for noise occurring from 10:00 p.m. to 7:00 a.m. (Caltrans 2013). Noise levels described by L_{dn} and CNEL usually differ by about 1 dBA or less. The relationship between the peakhour L_{eq} value and the L_{dn} /CNEL depends on the distribution of traffic during the day, evening, and night. Quiet suburban areas typically have CNEL noise levels in the range of 40 to 50 dBA, while areas near arterial streets are in the 50 to 60-plus CNEL range. Normal conversational levels are in the 60 to 65-dBA L_{eq} range; ambient noise levels greater than 65 dBA L_{eq} can interrupt conversations (Federal Transit Administration [FTA] 2018).

2.2 Vibration

Groundborne vibration of concern in environmental analysis consists of the oscillatory waves that move from a source through the ground to adjacent structures. The number of cycles per second of oscillation makes up the vibration frequency, described in terms of Hz. The frequency of a vibrating object describes how rapidly it oscillates. The normal frequency range of most groundborne vibration that can be felt by the human body starts from a low frequency of less than 1 Hz and goes to a high of about 200 Hz (Crocker 2007).

While people have varying sensitivities to vibrations at different frequencies, in general they are most sensitive to low-frequency vibration. Vibration in buildings, such as from nearby construction activities, may cause windows, items on shelves, and pictures on walls to rattle. Vibration of building components can also take the form of an audible low-frequency rumbling noise, referred to as groundborne noise. Groundborne noise is usually only a problem when the originating vibration spectrum is dominated by frequencies in the upper end of the range (60 to 200 Hz), or when foundations or utilities, such as sewer and water pipes, physically connect the structure and the vibration source (FTA 2018). Although groundborne vibration is sometimes noticeable in outdoor environments, it is almost never annoying to people who are outdoors. The primary concern from vibration is that it can be intrusive and annoying to building occupants and vibration-sensitive land uses.

Vibration energy spreads out as it travels through the ground, causing the vibration level to diminish with distance away from the source. High-frequency vibrations diminish much more rapidly than low frequencies, so low frequencies tend to dominate the spectrum at large distances from the source. Discontinuities in the soil strata can also cause diffractions or channeling effects that affect the propagation of vibration over long distances (Caltrans 2020). When a building is affected by

vibration, a ground-to-foundation coupling loss will usually reduce the overall vibration level. However, under rare circumstances, the ground-to-foundation coupling may actually amplify the vibration level due to structural resonances of the floors and walls.

Vibration amplitudes are usually expressed in peak particle velocity (PPV) or RMS vibration velocity. The PPV and RMS velocity are normally described in inches per second. PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is often used in monitoring of blasting vibration because it is related to the stresses that are experienced by buildings (Caltrans 2020).

2.3 Sensitive Receivers

Noise exposure goals for various types of land uses reflect the varying noise sensitivities associated with those uses. Sensitive land uses are generally defined as locations where people reside or where the presence of noise could adversely affect the use of the land. The San Benito County General Plan list of noise sensitive uses includes where people live, sleep, recreate, worship, and study (San Benito County 2015). Sensitive receivers in the area include the rural residences located to the west and east of the proposed expansion area and across John Smith Road to the southwest and southeast of the project site.

Vibration sensitive receivers are similar to noise sensitive receivers, such as residences and institutional uses (e.g., schools, libraries, and religious facilities). The General Plan does not identify vibration sensitive receivers, however concert halls, hospitals, libraries, research operations, residential areas, schools, and offices would also be considered vibration sensitive uses. Vibration sensitive receivers also include buildings where vibrations may interfere with vibration-sensitive equipment, affected by levels that may be well below those associated with human annoyance (FTA 2018; Caltrans 2013).

2.4 Project Noise Setting

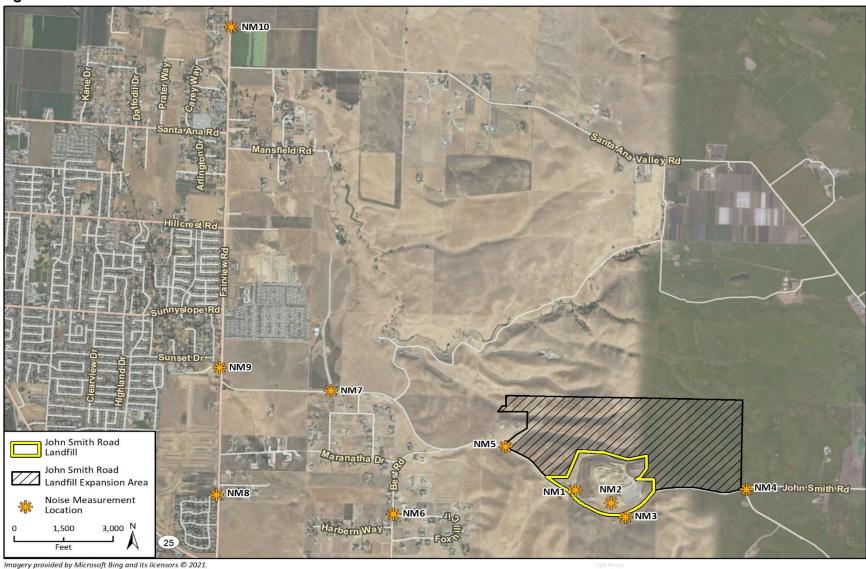

The most common source of noise in the project site vicinity is agricultural activities. Vehicular traffic from John Smith Road and Fairview Road are considered secondary noise sources in the immediate project area. To characterize ambient noise levels at and near the project site, ten 15-minute noise level measurements were conducted on July 21, 2021. Noise Measurements were conducted at the existing landfill entrance and tipping face to capture existing noise levels associated with landfill operations, and along John Smith Road, Fairview Road, and Best Road to capture existing traffic noise associated with each roadway. Table 2 summarizes the results of the noise measurements, Table 3 shows the recorded traffic volumes from the noise measurement, and Figure 4 shows the noise measurement locations.

Table 2 Project Site Vicinity Sound Level Monitoring Results

Measurement Location	Measurement Location	Sample Times	Approximate Distance to Primary Noise Source	L _{eq} (dBA)	L _{min} (dBA)	L _{max} (dBA)
1	At the landfill entrance	7:46 – 8:01 a.m.	Approximately 50 feet to landfill access road centerline	59	34	78
2	South of Phase 1 (existing)	8:16 – 8:31 a.m.	Approximately 150 feet to landfill working face	43	38	58
3	South of John Smith Road	8:58 – 9:13 a.m.	Approximately 100 feet to centerline of John Smith Road	60	31	80
4	South of the eastern expansion boundary	9:23 – 9:38 a.m.	Approximately 20 feet to centerline of John Smith Road	54	29	79
5	North of John Smith Road-Lima property	9:56 – 10:11 a.m.	Approximately 100 feet to centerline of John Smith Road	56	30	75
6	East of Best Road and north of Foxhill Circle	10:29 – 10:44 a.m.	Approximately 300 feet from agricultural operations	48	34	70
7	North of John Smith Road and west of Heatherwood Drive	10:56 – 11:11 a.m.	Approximately 50 feet to centerline of John Smith Road	70	33	88
8	West of Fairview Road and south of Old Ranch Road	11:30 – 11:45 a.m.	Approximately 50 feet to centerline of Fairview Drive	66	43	81
9	West of Fairview Road and south of St. Benedict Way	11:57 – 12:12 p.m.	Approximately 50 feet to centerline of Fairview Drive	63	36	79
10	West of Fairview Road and south of McCloskey Road	12:27 – 12:42 p.m.	Approximately 50 feet to centerline of Fairview Drive	66	38	89

Sound level measurements were conducted on July 21, 2021. Detailed sound level measurement data are included in Appendix A, and noise measurement locations are shown in Figure 4.

Figure 4 Noise Measurement Locations

Table 3 Sound Level Monitoring Traffic Counts

Measurement Location	Roadway	Traffic	Autos	Medium Trucks	Heavy Trucks
NM4	John Smith Road	15-minute count	Autos 2	0	0
INIVI4	John Sinth Road				
		One-hour equivalent	8	0	0
		Percentage	100%	0%	0%
NM5	John Smith Road	15-minute count	11	2	2
		One-hour equivalent	44	4	4
		Percentage	85%	7.5%	7.5%
NM6	Best Road	15-minute count	4	0	0
		One-hour equivalent	16	0	0
		Percentage	100%	0%	0%
NM7	John Smith Road	15-minute count	21	7	7
		One-hour equivalent	84	28	28
		Percentage	60%	20%	20%
NM9	Fairview Road	15-minute count	141	2	5
		One-hour equivalent	564	8	40
		Percentage	92.2%	1.3%	6.5%

Traffic counts were conducted on July 21, 2021. Traffic counts at corresponding measurement locations are shown in Figure 4.

2.5 Applicable Regulatory Setting

Federal

The FTA provides reasonable criteria for assessing construction noise impacts based on the potential for adverse community reaction in their *Transit and Noise Vibration Impact Assessment Manual* (FTA 2018). For residential, commercial, and industrial uses, the daytime construction noise threshold is 80 dBA L_{eq}, 85 dBA L_{eq}, and 90 dBA L_{eq} for an 8-hour period, respectively.

State

California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires each county and city to adopt a General Plan that includes a Noise Element prepared per guidelines adopted by the Governor's Office of Planning and Research. The purpose of the Noise Element is to limit the exposure of the community to excessive noise levels. CEQA requires all known environmental effects of a project be analyzed, including environmental noise impacts.

California Noise Control Act of 1973

California Health and Safety Code Sections 46000 through 46080, known as the California Noise Control Act, find that excessive noise is a serious hazard to public health and welfare and that exposure to certain levels of noise can result in physiological, psychological, and economic damage. The act also finds that there is a continuous and increasing bombardment of noise in urban, suburban, and rural areas. The California Noise Control Act declares that the State of California has a

responsibility to protect the health and welfare of its citizens by the control, prevention, and abatement of noise. It is the policy of the State to provide an environment for all Californians that is free from noise that jeopardizes their health or welfare.

San Benito County Noise Standards

The County's Health and Safety Element establishes noise standards for different land uses and contains policies that address aircraft noise, ground transportation-related noise, industrial noise, and construction-related noise. For transportation noise to residential uses, Table 9-2 (Table 5 of this document) of the Health and Safety Element sets a normally acceptable exterior noise standard of up to 65 dBA L_{dn}. The element's transportation land use compatibility standards are provided in Table 4 and non-transportation noise level performance standards for residential uses (new or existing) are provided in Table 5

Table 4 San Benito County Health and Safety Element Land Use Compatibility Guidelines for Community Noise Environments

	Con	nmunity Noise Ex	posure (L _{dn} or CNEL	, dB)
Land Use Category	Clearly Acceptable ¹	Normally Acceptable ²	Normally Unacceptable ³	Clearly Unacceptable ⁴
Residential – Low Density Single Family, Duplex, Mobile Home	<60	60-65	65-75	75+
Residential – Multiple Family	<60	60-65	65-75	75+
Transient Lodging – Motel, Hotel	<65	65-70	70-80	80+
School, Library, Church, Hospital, Nursing Home	<60	60-65	65-75	75+
Auditorium, Concert Hall, Amphitheater		<60	60-70	70+

Playground, Neighborhood Park	<55	55-65	65-75	75+
Golf Courses, Riding Stables, Water Recreation, Cemeteries	<60	60-70	70-80	80+
Office Building, Business Commercial and Professional	<65	65-75	75-80	80+
Industrial, Manufacturing, Utilities, Agriculture	<70	70-80	80+	

	Con	Community Noise Exposure (L _{dn} or CNEL, dB)			
Land Use Category	Clearly	Normally	Normally	Clearly	
	Acceptable ¹	Acceptable ²	Unacceptable ³	Unacceptable ⁴	

- 1 The noise exposure is such that the activities associated with the land use may be carried out with essentially no interference from aircraft noise. (Residential areas: both indoor and outdoor noise environments are pleasant.).
- 2 The noise exposure is great enough to be of some concern, but common building construction will make the indoor environment acceptable, even for sleeping quarters.
- 3 The noise exposure is significantly more severe so that unusual and costly building construction is necessary to insure adequate performance of activities. (Residential areas: barriers must be created between the site and prominent noise sources to make the outdoor environment tolerable.).
- 4 The noise exposure is so severe that construction costs to make the indoor environment acceptable for performance of activities would be prohibitive. (Residential areas: the outdoor environment would be intolerable for normal residential use.)

Table 5 San Benito County Health and Safety Element Non-Transportation Noise Level Performance Standards for Noise-Sensitive Uses

Noise Level Descriptor	7:00 a.m. to 10:00 p.m.	10:00 p.m. to 7:00 a.m.
dBA L _{eq} (1-hour)	55	45
L _{max}	70	65

Note: These standards apply to new or existing residential areas affected by new or existing non-transportation sources. Source: Table 9-1 of the San Benito County Health and Safety Element

The following goals and policies of the San Benito County 2035 General Plan Health and Safety Element are applicable to the proposed project:

GOAL HS-8

To protect the health, safety, and welfare of county residents through the elimination of annoying or harmful noise levels.

Policy HS-8.1 Project Design

The County shall require new development to comply with the noise standards shown in Table 4 and Table 5 through proper site and building design, such as building orientation, setbacks, barriers (e.g., earthen berms), and building construction practices. The County shall only consider the use of soundwalls after all design-related noise mitigation measures have been evaluated or integrated into the project or found infeasible.

Policy HS-8.2 Acoustical Analysis

The County shall require an acoustical analysis to be performed prior to development approval where proposed land uses may produce or be exposed to noise levels exceeding the "normally acceptable" criteria (e.g. "conditionally acceptable", "normally unacceptable") shown in Table 9-2. Land uses should be prohibited from locating, or required to mitigate, in areas with a noise environment within the "unacceptable" range.

Policy HS-8.3 Construction Noise

The County shall control the operation of construction equipment at specific sound intensities and frequencies during daytime hours between 7:00 a.m. and 6:00 p.m. on weekdays and 8:00 a.m. and 5:00 p.m. on Saturdays. No construction shall be allowed on Sundays or federal holidays.

Policy HS-8.7 Acceptable Vibration Levels

The County shall require construction projects anticipated to generate a significant amount of vibration to ensure acceptable interior vibration levels at nearby noise-sensitive uses based FTA criteria.

Policy HS-8.8 Noise Exemptions

The County shall support the exemption of the following noise sources from the standards in this element:

- a. Emergency warning devices and equipment operated in conjunction with emergency situations, such as sirens and generators which are activated during power outages. The routine testing of such warning devices and equipment shall also be exempt provided such testing occurs during the hours of 7:00 am to 10:00 pm.
- b. Activities at schools, parks, or playgrounds, provided such activities occur during daytime hours.
- c. Activities associated with County-permitted temporary events and festivals.

Policy HS-8.10 Reduction in Noise Levels at Existing Land Uses

Reduce traffic noise levels where expected to significantly impact sensitive receptors through the installation of noise control measures such as quiet pavement surfaces, noise barriers, traffic calming measures, and interior sound insulation treatments.

Policy HS-8.11 New Project Noise Mitigation Requirements

Require new projects to include appropriate noise mitigation measures to reduce noise levels in compliance with Table 9-1 and 9-2 standards within sensitive areas (Table 4 and Table 5 of this report). If a project includes the creation of new non-transportation noise sources, require the noise generation of those sources to be mitigated so they do not exceed the interior and exterior noise level standards of Table 9-2 (and Table 5 of this report) at existing noise-sensitive areas in the project vicinity, unless an exception is made by the County on a case-by-case basis. However, if a noise-generating use is proposed adjacent to lands zoned for residential uses, then the noise generating use shall be responsible for mitigating its noise generation to a state of compliance with the standards shown in Table 9-2 (Table 4 of this report) at the property line of the generating use in anticipation of the future residential development, unless an exception is made by the County on a case-by-case basis.

Policy HS-8.12 Construction Noise Control Plans

Require all construction projects to be constructed within 500 feet of sensitive receptors to develop and implement construction noise control plans that consider the following available controls in order to reduce construction noise levels as low as practical:

- Utilize 'quiet' models of air compressors and other stationary noise sources where technology exists;
- Equip all internal combustion engine-driven equipment with mufflers, which are in good condition and appropriate for the equipment;

- Locate all stationary noise-generating equipment, such as air compressors and portable power generators, as far away as possible from adjacent land uses;
- Locate staging areas and construction material areas as far away as possible from adjacent land uses;
- Prohibit all unnecessary idling of internal combustion engines;
- Notify all abutting land uses of the construction schedule in writing; and Designate a "disturbance coordinator" (e.g. contractor foreman or authorized representative) who would be responsible for responding to any local complaints about construction noise. The disturbance coordinator will determine the cause of the noise complaint (e.g., starting too early, bad muffler, etc.) and will require that reasonable measures warranted to correct the problem be implemented. Conspicuously post a telephone number for the disturbance coordinator at the construction site and include it in the notice sent to neighbors regarding the construction schedule.

San Benito County Noise Control Regulations Ordinance

Section 19.39.030 of the San Benito County Code lists maximum permissible sound levels in the County. The section states:

- No person shall operate, or permit to be operated, on private property any source of sound in such a manner as to create:
 - A sound pressure level which exceeds the limits set forth for the receiving land use category in Table 6 which may be measured at or within the real property boundary of the receiving land use, or its vertical extension;
 - A sound pressure level which exceeds the limits set forth for the receiving land use category in Table 6 for more than 15 minutes in 60 minutes which may be measured at or within the real property boundary of the receiving land use, or its vertical extension; or
 - An equivalent A-weighted sound level that exceeds the limits set forth for the receiving land use category in Table 6 which may be measured at or within the real property boundary of the receiving land use or its vertical extension.
 - A sound level that exceeds the ambient sound level by 5 dB which may be measured at or within the real property boundary of the receiving land use or its vertical extension.

Table 6 San Benito County Code Maximum Sound Level Standards

Land Use Designation	Noise Level Limit (dBA)7:00 a.m. to 10:00 p.m.	Noise Level Limit (dBA) 10:00 p.m. to 7:00 a.m.
Ag Rangeland Ag Productive Rural	45	35
Rural Transitional Rural Residential	45	35
Single-Family (R1) Residential Multiple (RM) Planned Unit Development	50	40

Land Use Designation	Noise Level Limit (dBA)7:00 a.m. to 10:00 p.m.	Noise Level Limit (dBA) 10:00 p.m. to 7:00 a.m
Commercial (C-1) Commercial (C-2)	65	55
ontrolled Manufacturing (CM) ight Industrial (M-1) leavy Industrial (M-2)	70	60

Section 19.39.051 (H) exempts temporary construction, demolition or maintenance of structures between the hours of 7:00 a.m. and 7:00 p.m., except Sundays and federal holidays from the standards in Table 6. Although construction activity is exempt from the noise standards shown above, for purposes of this analysis, the FTA Transit Noise and Vibration Impact Assessment (FTA 2018) criteria will be used. The FTA provides reasonable criteria for assessing construction noise impacts based on the potential for adverse community reaction. For residential uses, the daytime noise threshold is 80 dBA Leq for an 8-hour period.

Section 19.39.051 (N) exempts facilities owned or operated by or for a governmental agency from provisions of Chapter 19.39 Noise Control Regulations Ordinance.

3 Methodology

3.1 Construction Noise

Construction noise was estimated using the FHWA Roadway Construction Noise Model (RCNM) (FHWA 2006). RCNM predicts construction noise levels for a variety of construction operations based on empirical data and the application of acoustical propagation formulas. Using RCNM, construction noise levels were estimated at noise sensitive receivers near the project site. RCNM provides reference noise levels for standard construction equipment, with an attenuation rate of 6 dBA per doubling of distance for stationary equipment.

Variation in power imposes additional complexity in characterizing the noise source level from construction equipment. Power variation is accounted for by describing the noise at a reference distance from the equipment operating at full power and adjusting it based on the duty cycle of the activity to determine the L_{eq} of the operation (FHWA 2006). Each phase of construction has a specific equipment mix, depending on the work to be accomplished during that phase. Each phase also has its own noise characteristics; some will have higher continuous noise levels than others, and some have high-impact noise levels.

Construction activity would result in temporary noise in the project site vicinity, exposing surrounding nearby receivers to increased noise levels. Construction noise would typically be higher during the heavier periods of initial construction (i.e., site preparation and grading) and would be lower during the later construction phases (i.e., building construction and paving). Typical heavy construction equipment during project grading could include dozers, loaders, graders, and dump trucks. It is assumed that diesel engines would power all construction equipment. Construction equipment would not all operate at the same time or location. In addition, construction equipment would not be in constant use during the 8-hour operating day.

Project construction would occur nearest to the single-family residence to the west of the project site during western stormwater basin and western stockpile construction. Over the course of a typical construction day, construction equipment would be located as close as 85 feet to the nearest residential property line to the west but would typically be located at an average distance farther away due to the nature of construction and the size of the project. For example, during a typical construction day, the equipment may operate across the horizontal distance of the site (85 to 235 feet) from the residential receiver to the west of the project site. Construction equipment would be located as close as 85 feet to this property but would typically operate at an average distance of 150 feet. Therefore, it is assumed that over the course of a typical construction day the construction equipment would operate at an average distance of 150 feet from the single-family residence to the west and 2,200 feet and 2,300 feet from single family residences to the east and south of the project site, respectively.

Construction noise is typically loudest during activities that involve excavation and soil movement, such as site preparation and grading. A potential high-intensity construction scenario includes a grader, loader, dozer, and dump truck working during grading to excavate and move soil. At a distance of 85 feet, an excavator, a compactor, a dozer, and a dump truck would generate a noise level of 78 dBA L_{eq} (RCNM calculations are included in Appendix B).

3.2 Groundborne Vibration

The project does not include any substantial vibration sources associated with operation. Thus, construction activities have the greatest potential to generate groundborne vibration affecting nearby receivers, especially during grading and excavation on the project site. The greatest vibratory source during construction within the project vicinity would be a bulldozer. Neither blasting nor pile driving would be required for the project. Vibration estimates are based on vibration levels reported by Caltrans and the FTA (Caltrans 2020, FTA 2018). Table 7 shows typical vibration levels for various pieces of heavy-duty equipment used in the assessment of vibration (FTA 2018).

Table 7 Vibration Levels Measured during Construction Activities

Equipment	PPV at 25 ft. (in/sec)	
Large Bulldozer	0.089	
Loaded Trucks	0.076	
Small Bulldozer	0.003	
Source: FTA 2018		

Although groundborne vibration is sometimes noticeable in outdoor environments, it is almost never annoying to people who are outdoors; therefore, the vibration level threshold is assessed at occupied structures (FTA 2018). Therefore, all vibration impacts are assessed at the structure of an affected property.

3.3 Operational Noise Sources

On-site noise source would include site entrance activities, working face operations, and daily cap and cover activities. Entrance activities include trucks entering the facility, stopping at the scale house, idling, and accelerating away from the scale house. Radio and conversational noise also make up the noise environment at the entrance. Maximum noise levels associated with entrance activities range between 60 dBA and 78 dBA L_{max} . The short-term noise measurement of entrance activities measured 59 dBA L_{eq} for a 15-minute measurement period, based on measurement site NM1 shown in Table 2. Working face operations typically include vehicles idling while depositing dump loads and a bulldozer scraping and organizing the working face debris. Using RCNM, a bulldozer generates a noise level of 80 dBA at 50 feet and would be the dominant noise source at the working face. Daily cap and cover activities would occur at the active working face to help minimize odors, prevent emergence of flies, and minimize the potential for fires to ignite. Equipment used for cap and cover activities include dozers, compactors, and water trucks ("dump truck" used as proxy) generating noise levels ranging from 75 dBA to 82 dBA L_{max} at 50 feet and a combined noise level of 81 dBA L_{eq} at 50 feet.

3.4 Traffic Noise

Noise affecting the project area is primarily from traffic on Fairview Road and John Smith Road. Traffic noise was modeled with the FHWA RD-77-108 Traffic Noise Prediction Model. The traffic volumes from the Revised Draft Environmental Impact Report 2035 San Benito County General Plan Update Chapter 19, Transportation and Circulation were input into the model as shown in Table 8 (San Benito County 2015).

Table 8 Traffic Volumes

Roadway	Segment	Existing ADT	Existing with Project ADT	General Plan Buildout Year 2035 ADT	General Plan Buildout Year 2035 with Project ADT
Fairview Road	Airline Highway to Union Road	3,410	3,783	10,396	11,055
	Sunnyslope Road to Hillcrest Road	5,460	5,833	24,215	24,874
	Hillcrest Road to Meridian Street	7,120	7,493	30,112	30,771
	Santa Ana Road to McCloskey Road	6,120	6,493	26,118	26,777
	McCloskey Road to Orchard Road	5,670	6,043	15,347	16,006
John Smith Road	Fairview Road to Best Road	500	873	566	1,225
Best Road	John Smith Road to Airline Highway	384 ¹	757	3841	1,043

¹ Derived from traffic counts during noise measurement NM6, see Table 3.

See Appendix C for traffic volumes.

Source: Revised Draft Environmental Impact Report 2035 San Benito County General Plan Update Chapter 19 Transportation and Circulation 2015

The project's contribution to the existing traffic noise levels along area roadways was determined by comparing the predicted noise levels at a reference distance of 50 feet from the roadway centerline for existing and future conditions with and without project-generated traffic. Existing trip generation of 373 trips on a peak traffic day is based on the landfill's on site records of vehicles accessing the landfill between 2016 and 2018. Future trip generation is based on population growth projections and expansion of the landfill capacity included in the San Benito Regional Transportation Plan for 2040, which determined the project would result 659 future trips (San Benito County 2015). The posted speed limits on Fairview Road and John Smith Road are 55 miles per hour (mph). There is not a posted speed limit for Best Road, however, for this analysis it is assumed to be 45 mph as it is a rural road with no speed limit. To determine the vehicle classification mix for modeling, the observed mix from noise measurement sites were used, which observed 92.2 percent automobiles, 1.3 percent medium trucks, and 6.5 percent heavy trucks for Fairview Road and 85 percent automobiles, 7.5 percent medium trucks, and 7.5 percent heavy trucks for John Smith Road. Traffic observed along Best Road was 100 percent automobiles.

3.5 Significance Thresholds

The following thresholds are based on County of San Benito noise standards and Appendix G of the CEQA Guidelines. Noise impacts would be considered significant if:

• **Item 1.** The project would result in the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

- Based on the County of San Benito Noise Control Regulations Ordinance Section
 19.39.051(H) and FTA construction noise standards, construction noise would be significant if:
 - Construction work is conducted between the hours of 7:00 p.m. and 7:00 a.m. on weekdays, 5:00 p.m. and 8:00 a.m. on Saturdays, and at any time on Sundays or federal holidays.
 - Noise levels exceed the FTA daytime criteria of 80 dBA L_{eq}, 85 dBA L_{eq}, and 90 dBA L_{eq} for an 8-hour period for residential, commercial, and industrial land uses, respectively.
- Based on San Benito County Noise Control Regulations Ordinance, operational noise would be significant if:
 - Noise levels exceed the ambient noise level by 5 dBA at or within the real property boundary of the receiving land use.
- Traffic-related noise impacts would be considered significant if project-generated traffic would result in exposure of sensitive receivers to an unacceptable increase in noise levels.
 - For purposes of this analysis, a significant impact would occur if project-related traffic increases the ambient noise environment of noise-sensitive land uses by 3 dBA or more if the locations are subject to noise levels in excess of normally compatible levels, or by 5 dBA or more if the locations are not subject to noise levels in excess of the normally compatible levels identified in the San Benito County General Plan.
- Item 2. The project would result in the generation of excessive groundborne vibration or groundborne noise levels.
 - Vibration levels equal to or below 0.4 in./sec. PPV at residential structures would prevent structural damage for most residential building. For human annoyance, the vibration level threshold at which transient, or temporary, vibration sources are considered to be distinctly perceptible is 0.24 in./sec. PPV.
- Item 3. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, if the project exposes people residing or working in the project area to excessive noise levels.

4 Impact Analysis

4.1 Item 1 – Temporary and Permanent Noise Increase

Item: Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? (Less Than Significant Impact with Recommendations)

Construction

As described in Section 3.1, at a distance of 85 feet, an excavator, a compactor, a dozer, and a dump truck would generate a noise level of 78 dBA L_{eq} . Project construction activities would include building the new entrance facilities, constructing the individual landfill modules, clean closing the Class I area, constructing landfill support facilities such as detention basins, constructing the LFG-to-energy facility, and installing the final landfill cover. These construction projects would occur over the life of the project as individual components are needed. Construction activities proposed for western stormwater basins and stockpiles, as well as eastern stormwater basins and stockpiles would have the potential to increase ambient noise levels at residences to the west and east of the project site.

The nearest single-family residence to the west of the site would be exposed to project construction noise levels of 73 dBA L_{eq} at 150 feet. The model does not take into account the potential shielding provided by intervening topography. The nearest single-family residence to the east and south of the project site would be exposed to project construction noise levels of 49 dBA L_{eq} at 2,200 feet and 2,300 feet, respectively (see Appendix B for construction noise modeling results). These noise levels would not exceed the FTA daytime criteria of 80 dBA L_{eq} .

Section 19.39.051(H) of the San Benito County Noise Control Regulations Ordinance exempts construction activities from noise ordinance standards during the hours of 7:00 a.m. to 7:00 p.m. on weekdays, 8:00 a.m. and 5:00 p.m. on Saturdays. Construction activities are not allowed any time on Sundays or federal holidays. In addition, Section 19.39.051(N) of the San Benito County Noise Control Regulations Ordinance exempts facilities owned or operated by or for a governmental agency. Because the project site is owned by San Benito County, it would not be subject to the Noise Control Regulations Ordinance regulations. However, because construction activities would occur within 500 feet of sensitive receptors, preparation and implementation of a Noise Control Plan would be required pursuant to Policy HS-8.12 of the 2035 General Plan. The plan includes measures to reduce construction noise, such as requiring mufflers on all construction equipment and preventing equipment from idling when not in use. However, as demonstrated in the RCNM calculations, even without noise reduction measures, project construction equipment noise would not exceed applicable FTA daytime thresholds. Therefore, impacts from construction noise would be less than significant.

Operation

The project would introduce sources of operational noise to the site, including site entrance activities, working face operations, and daily cap and cover activities. The landfill is open 8:00 a.m. to 4:00 p.m. Monday through Friday and 9:00 a.m. to 3:00 p.m. on Saturdays and Sundays. There

would be no landfill activity during nighttime hours. As stated above, Section 19.39.051 (N) exempts facilities owned or operated by or for a governmental agency from provisions of Chapter 19.39 Noise Control Regulations Ordinance. Assumptions for these sources are discussed in Section 3.3. Noise levels at the nearest properties from each noise source and their combined noise levels are shown in Table 9.

Table 9 Operational Noise Levels at Off-site Land Uses

			No	Noise Level (dBA L _{eq})			
Receiver	Description	Entrance Activities	Working Face Operations	Cap and Cover Activities	Combined	Exceed Thresholds?²	
Residential	West of site	23 ¹	491	50 ¹	53	No	
Residential	South of site	24	431	441	47	No	
Residential	East of site	18	421	431	46	No	

¹ Assumes a -3 dBA reduction for intervening topography.

As shown in Table 9, combined operational activities on the project site would generate noise levels up to 53 dBA L_{eq} at the nearest noise sensitive residential use to the west. The combined operational noise from site entrance activities, working face operations, and daily cap and cover activities would not exceed San Benito County's daytime noise standard of 55 dBA L_{eq} .

Off-site Traffic Noise

The project would generate new vehicle trips that would increase noise levels on nearby roadways, which would occur primarily on Fairview Road and John Smith Road. Best Road and a proposed new alternative route that would run south of the landfill entrance and adjacent to a noise sensitive residential use before connecting to Best Road via the existing driveway of the residential use have also been analyzed. The increase in roadway noise with the addition of project traffic is shown in Table 10. Traffic data was obtained from the Revised Draft Environmental Impact Report 2035 San Benito County General Plan Update Chapter 19, Transportation and Circulation (San Benito County 2015). Based on increases in overall ADT volumes from project-generated traffic, the noise level increases would range between less than 1 dBA L_{dn} to be 7 dBA L_{dn}.

Table 10 Off-site Traffic Noise Increases at 50 feet

Roadway	Segment	Existing Noise Level (dBA)	Existing + Project Noise Level (dBA)	Noise Level Increase (dBA)	2035 Noise Level ² (dBA)	2035+ Project Noise Level (dBA)	Noise Level Increase (dBA)
Fairview Road	Airline Highway to Union road	64	65	<1	69	69	<1
	Sunnyslope Road to Hillcrest Road	66	67	1	73	73	<1
	Hillcrest Road to Meridian Street	67	68	<1	74	74	<1
	Santa Ana Road to McCloskey Road	67	67	<1	73	73	<1

² Thresholds would be exceeded if exterior noise levels exceed 55 dBA from 7:00 a.m. to 10:00 p.m.

Roadway	Segment	Existing Noise Level (dBA)	Existing + Project Noise Level (dBA)	Noise Level Increase (dBA)	2035 Noise Level ² (dBA)	2035+ Project Noise Level (dBA)	Noise Level Increase (dBA)
	McCloskey Road to Orchard Road	66	68	2	71	71	<1
John Smith Road	Fairview Road to Best Road	57	59	2	57	60	3
Best Road	John Smith Road to Airline Highway	51	57	6	51	58	7
New Alternative Route	John Smith Road to Best Road	48¹	49	1	48¹	55	7

¹ Existing ambient noise level based on NM6, see Table 2.

The existing route to the landfill, Fairview Road to John Smith Road, would experience future 2035 traffic noise level increase of less than 1 dBA to 3 dBA. John Smith Road would experience a 3 dBA increase when comparing existing scenario to existing plus project and 2035 and 2035 plus project traffic scenarios; however, the increase would not exceed the County's land use compatibility threshold of 60 dBA L_{dn} for residential uses. Therefore, off-site project traffic increases on the existing route to the landfill would be less than significant.

As shown in Table 10, alternative routes analyzed resulted in off-site traffic increases of more than 5 dBA when comparing existing to existing plus project and 2035 and 2035 plus project traffic scenarios. Best Road is a narrow two-way road without a shoulder. There are seven single family homes located adjacent to Best Road and would be impacted by the introduction of project traffic. The proposed new alternative route that would run south of the landfill entrance and adjacent to a noise sensitive residential use before connecting to Best Road via the existing residential driveway and the residential use would be exposed to a new noise source. This new alternative route would result in a 7 dBA increase over ambient noise levels at the existing residential use. Therefore, off-site project traffic increases on alternative routes analyzed would be significant.

Recommendations

Recommendation NOI-1 would be implemented to ensure off-site traffic noise increases do not exceed the 5 dBA over ambient threshold.

NOI-1 Off-Site Traffic Noise Reductions for Alternative Landfill Routes

The project applicant shall reduce traffic noise levels at the adjacent single-family uses along alternative routes proposed. Prior to expansion of the landfill, an alternative route plan shall be developed and implemented so that off-site traffic noise levels do not exceed a 5 dBA increase on Best Road or the new alternative route through measures such as, but not limited to:

- Resurface Best Road and proposed new alternative route with rubberized asphalt concrete overlay or grind and groove pavement.
- Install soundwalls 6-foot in height along Best Road and proposed new alternative route at noise sensitive residential uses.

Source: Revised Draft Environmental Impact Report 2035 San Benito County General Plan Update Chapter 19 Transportation and Circulation 2015.

 Implementation of routes that does not have project truck traffic travel on Best Road or the new alternative route.

Significance After Recommendation

With implementation of Mitigation Measure NOI-1, installation of noise reducing road surface and soundwalls, traffic noise levels would be reduced at the residential uses by 4 dBA to 7 dBA (Illingworth and Rodkin 2011). Alternatively, if no route is chosen on Best Road or the new alternative route, the project would not generate off-site traffic noise levels that exceed thresholds. Therefore, off-site traffic noise level increases would be reduced to a level that does not exceed the increase over ambient threshold, and impacts would be less than significant.

4.2 Item 2 – Vibration

Item: Would the project result in generation of excessive groundborne vibration or groundborne noise levels? (*Less Than Significant Impact*)

Construction activities known to generate excessive groundborne vibration, such as pile driving, would not be conducted by the project. The greatest anticipated source of vibration during general project construction activities would be from a dozer, which may be used within 250 feet of the nearest off-site structure. A dozer creates approximately 0.089 in./sec. PPV at a distance of 25 feet (Caltrans 2020). This would equal a vibration level of 0.0071 in./sec. PPV at 250 feet. This vibration level is lower than the threshold of 0.24 in./sec. PPV. Therefore, temporary impacts associated with construction would be less than significant.

The project does not include any substantial vibration sources associated with operation. Therefore, operational vibration impacts would be less than significant.

4.3 Item 3 – Airport Noise

Item: For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels? (*No Impact*)

The Hollister Municipal Airport is the nearest airport, located approximately 5.6 miles to the northwest of the project site. According to the noise compatibility contours figure for the Comprehensive Land Use Plan Hollister Municipal Airport (San Benito County Airport Land Use Commission 2012), the project site is located outside the airport's 60 dBA CNEL noise contour. Therefore, no substantial noise exposure from airport noise would occur to construction workers, users, or employees of the project, and no impacts would occur.

5 Conclusions

The project would generate both temporary construction-related noise and long-term noise associated with operation of the project. The project's noise exposure from construction would not exceed the County's noise thresholds and construction-related noise impacts would be less than significant.

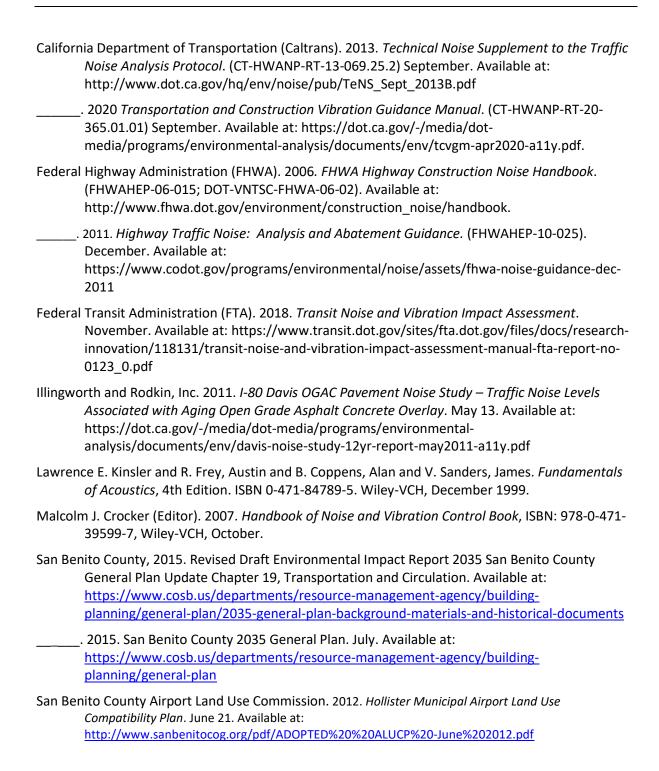

Combined operational activities on the project site would generate noise levels up to 53 dBA L_{eq} at nearest residential use to the project site. The combined operational noise from site entrance activities, working face operations, and daily cap and cover activities would comply with San Benito County's daytime noise standard, and the project would be consistent with the San Benito County noise standards.

Project-generated traffic would generate an increase of up to 7 dBA on analyzed roadways. Best Road and the proposed new alternative route would experience the largest traffic noise level increase when comparing existing to existing plus project traffic and 2035 to 2035 plus project traffic scenarios. Implementation of Recommendation NOI-1, off-site traffic noise reductions for alternative routes, off-site traffic increases would be reduced to a level that does not exceed the increase over ambient threshold; therefore, the off-site traffic noise increase would be less than significant.

The project would generate groundborne vibration during construction. Groundborne vibration would not exceed the applicable vibration threshold at the nearest structures, and construction-related vibration impacts would be less than significant.

The project site is outside the noise contours for the Hollister Municipal Airport. Therefore, no substantial noise exposure would occur to construction workers, employees, or users of the project from aircraft noise.

Notes:

¹The reported delay and corresponding LOS for signalized and all-way stop-controlled intersections represents the average delay for all intersection approaches. The reported delay and corresponding LOS for one- and two-way stop-controlled intersections are based on the worst-case stop-controlled approach.

Entries denoted in bold indicate conditions that exceed the current LOS standard. Entries denoted in <u>underlined</u> indicate significant impact.

²Intersection is oversaturated and delays are excessive. An accurate delay cannot be calculated since the traffic volume levels and resulting oversaturated conditions exceed the bounds of the unsignalized LOS methodology.

³Future intersection.

⁴Signal warrant analysis only applies to unsignalized intersections.

Notes:

The reported delay and corresponding LOS for signalized and all-way stop-controlled intersections represents the average delay for all intersection approaches. The reported delay and corresponding LOS for one- and two-way stop-controlled intersections are based on the worst-case stop-controlled approach.

²Intersection is oversaturated and delays are excessive. An accurate delay cannot be calculated since the traffic volume levels and resulting oversaturated conditions exceed the bounds of the unsignalized LOS methodology.

Future intersection.

⁴Signal warrant analysis only applies to unsignalized intersections.

Entries denoted in bold indicate conditions that exceed the current LOS standard. Entries denoted in <u>underlined</u> indicate significant impact.
